

Sintered Glass Filter Media

BIO RIO G

Start shipping now

Bio Rio G is highly porous filter media made of sintered glass. It has a structure that is suitable for microorganism colonization, and can be used as a main biological filter material. Bio Rio G can also be used to raise the height of the substrate, and to increase humidity in a Neo Glass Air tank by spreading it inside.

Product Characteristics

1. Having highly porous surface area, it provides intensive colonization of beneficial bacteria and high filtration performance.
2. The irregular shape gives gaps between media granules, and clogging is less likely to occur.
3. It provides long-term, stable filtration capacity because it hardly affects pH and the hardness of water.

You can spread Bio Rio G in a Neo Glass Paluda to raise humidity inside the tank.
